HONG KONG: For the first time, slow loris as they move high in the canopy,” he told Dental Tribune Asia Pacific. “But we hope to collar more animals as we need a larger sample size to publish new insights into the animal, which is being threatened by illegal pet and ornamental trade in South-East Asia.

Discovered and classified first in 1785, the Bornean slow loris has recently become a rare sight in the jungles of Borneo. Figures of the total population do not exist but wildlife experts expect the density today to be around five animals per square kilometre, a dramatic decline from up to 80 per square kilometre in the 1980s.

The study, which receives funding from the Cleveland Metroparks and Columbus Zoos in the US, aims to find out where the animal sleeps or regularly defends, which is being threatened by illegal pet and ornamental trade in South-East Asia.

The next generation in surface technology designed to deliver:

- Higher security and faster osseointegration for every indication
- Reduced healing times from 6–8 weeks down to 3–4 weeks
- Increased treatment predictability in critical protocols

Higher security and faster osseointegration for every indication

Reduced healing times from 6–8 weeks down to 3–4 weeks

Increased treatment predictability in critical protocols
