tooth is lost to disease? Once the referring doctors are made aware of the favorable benefits that will be derived, it becomes difficult for a conscientious person to object to this concept of eliminating untoward possibilities that can lead to failure of treatment.

Conclusion

The System “S” protocol demands thoroughness in treatment of the entire root canal system. The author uses a calamus for the system “S” protocol during the apical half of the root canal system. It should not be a problem in degrading the basic principles of bonding technology, restorative priciples and post core placement into our normal endodontic treatment protocol. We, as a specialty, should be thinking in terms of being responsible for presenting anything humanly possible to increase the predictability of our treatment. When endodontic treatment fails, it seems like everyone “stands around in a circle and points at one another.” Adhering to proven principles eliminates the probability of contamination of the canal system by providing a solid foundation for the restorative aspect of the patient treatment. Obviously, those who are so concerned with the endodontic lack of respect for radicular space have not witnessed what often happens to that same tooth when preparing it for a crown. It is imperative for the endodontic and restorative to be a team, working together for predictability, in the interest of the patient.

Our job as “endo-doers” is to learn, become teachers and educate the patients, staff and doctors we work with, so we can achieve dental health as a team. Let’s not “cave into” the demands of public convenience or political pressure, but rather be governed by proven dental principles, so we can achieve predictable endodontic success, saving the teeth our patients are born with, but in what endodontics is all about?

whitening levels as low as 89, when compared with some leading stain removal products on the market which scored as high as 186. It is important to note that although there are many leading whitening toothpastes on the market, many of these contain extremely high abrasion levels, which will strip away at the enamel over time. This can cause a range of problems, including increased sensitivity to hot and cold products, as well as causing teeth to appear yellow over time - quite the opposite function of a whitening toothpaste! It is important that patients are well informed of the dangers of using toothpaste which contain high abrasion levels, which generally will do more harm than good to one's teeth. Beverly Hills Formula is continuously researching ways of keeping abrasive levels at a minimum, whilst obtaining the maximum whitening effect.

Whilst it is extremely important to keep abrasion levels at a minimum, it is also important to ensure patient satisfaction and value for money. Results, ensuring patient satisfaction and value for money, Beverly Hills Formula whitening toothpastes have been proven to be one of the best on the market. The most recent stain removal study, conducted by a leading UK dental school, found that Beverly Hills Formula products are the best whitening toothpastes on the market, removing up to 90% of stains after a five minute period. Compare this with other leading whitening brands, which scored as low as 40%. Beverly Hills Formula strives to help patients achieve professional whitening results without the need for harsh abrasives or bleach. Their innovative and cutting edge products have paved the way for high quality and safe teeth whitening in the home.

The company has long proven themselves as fore runners in expert at-home teeth whitening. By continuously researching cutting edge methods, the Beverly Hills Formula brand has ensured that they are constantly ahead of their competitors.

Teeth and gum sensitivity effects over 50% of adults

By Jordan

Sensitivity is a growing oral care health concern and preventing sensitivity starts by keeping the teeth enamel strong & healthy. Sensitivity is in many of the markets the Nr. 1 concern influencing purchase. Consumers want products that work well but are also gentle to their teeth enamel and gums.

Many people suffer from sensitive teeth and it can start at any time. It is more common in people aged between 20 and 40, although it can affect people in their early teens and when they are over 70. Women are more likely to be affected than men.

If sensitivity effects so many people why are they not buying more “sensitive” oral care products?

Research tells us that most consumers, as many as 90%, find it difficult to choose products. So how can we help consumers find the right products for them? It can start at the dentist. Dental professionals recommend that consumers choose toothbrushes with soft bristles as these are gentle on their teeth enamel and gums. They also prefer smaller heads as it is easier to navigate around the mouth and clean difficult areas, especially the back molars where cavities tend to start.

Manufacturers can also help by making “sensitive” products more attractive and readily available with clear and easy to understand information. In 2014 there was a rise in the number of launches with enamel focus.
