**DUBAI, UAE:** CAPP has the pleasure to welcome you to a Dubai dental meeting from the upper echelon in Dental Medicine at the spectacular The Palace Hotel Downtown Dubai. The full solution for clinical and Lab restorations, designed for beginners, advanced and future CEREC users will get together the ‘creme de la creme’ in Prosthodontics, Implantology, Aesthetics and digital dentistry. An event, first of its kind taking place in the heart of Dubai featuring exceptional panelists and trainers, rounding up with an unforgettable social program.

The event featuring Dentists and Dental Technicians - beginners, advanced and future CEREC users who are just considering this revolutionary system or for the professionals who would like to keep up with latest trends in high tech dentistry. The two days will cover a Panel Show on 12th of September and Table Clinic Presentations on 11, 12 and 15th September 2014.

The panel show on 12th September, known as CEREC Desert Fest will look at the networks, which exist within the digital dental world. The five panelists will have debates after each presentation amongst each with their vast knowledge will show how fast the digital technology and science joined up unexpectedly in dentistry, faster than we ever imagined. All panelists will have debates after each presentation amongst each.

**Dr. Aisha Sultan Al Suwaidi officially elected to lead the APDF for 2014-2015**

**By Emirates Dental Society**

**DUBAI, UAE:** In the presence of His Excellency, the Minister of Health, Dr. Abdullah Al Oweis, Dr. Aisha Sultan Al Suwaidi, Head of Dental Services in Ministry of Health and Head of Dental Chapter of Emirates Medical Association, has been officially elected to lead the Asian Pacific Dental Federation for the year 2014-2015.

Representatives of 52 countries attended the ceremony. Accordingly, the United Arab Emirates has hosted the Asian Pacific Dental Congress from 17-19th June 2014, with pre-congress workshop and a very rich scientific program.

---

**Over 1,580 dental professionals attended the 9th CAD/CAM & Digital Dentistry Int’l Conference**

**By Dental Tribune MEA**

**DUBAI, UAE:** The 9th edition of the CAD/CAM & Digital Dentistry International Conference gathered 1,580 dental professionals, leading industrial players and visitors from 57 countries at the Jumeirah Beach Hotel on 09-10 May 2014 for the biggest Digital Dentistry Show.

Participants Feedback

We received great feedback from participants attending the conference, which can all be summarized into a message with their vast knowledge will show how fast the digital technology and science joined up unexpectedly in dentistry, faster than we ever imagined. All panelists will have debates after each presentation amongst each.

Dental Wings integrates Neodent implants into guided surgery software

Curtiba, Brazil/Montreal, Canada: Dental Wings, international provider of CAD/CAM and guided surgery solutions for dental laboratories and clinics, has announced that it has integrated products from Brazilian implant manufacturer Neodent into its coDiagnostiX software. Through the collaboration, users of the guided surgery software will gain access to Neodent’s implant and sleeve system, consisting of two implant series, three sleeves and one fixation pin.

Neodent is one of the leading dental implant companies in Latin America and targets the nonpremium segment in the implant market, thus making its products accessible to a broader population. According to Matthias Schupp, Neodent’s executive vice president of sales and marketing, the company has sold over 5 million implants to 50,000 clinicians worldwide already.

Frank Stockmann, vice president of guided surgery at Dental Wings, said that his company is pleased to be able to give its customers access to products from one of the most rapidly expanding implant companies in the world through its coDiagnostiX software. “We are confident that Neodent customers will enjoy the benefits of a sophisticated and user-friendly guided surgery solution,” he added.

Neodent was founded in 1995 and was the first Brazilian company in the implant segment to receive certification from the Brazilian ministry of health. Headquartered in Curtiba in Brazil, the company runs subsidiaries in the U.S., Mexico, Portugal and Spain. Today, Neodent employs more than 900 people, operates more than ten branches in Brazil and works with a wide network of distributors.

In addition to coDiagnostiX, which was acquired from Straumann in 2013, Dental Wings offers an open CAD/CAM platform called DWOS, both of which are aimed at improving the quality of restorations and dental treatment, and increasing the productivity of laboratories and clinicians. The company announced that coDiagnostiX will be fully integrated with the DWOS platform by fall 2014.

New treatment center from Sirona: Quality “made in Germany” at an attractive price

By Sirona

The dental industry, has introduced a new treatment center: INTEGO offers top quality and flexible configuration options at an attractive price.

All dentists around the world share a common wish: To provide their patients with the best possible treatment. That’s why they ideally want to work with high-quality devices and systems which offer optimum support for their day-to-day work. The treatment center plays a key role here; after all, this is where they spend a large part of their working day. As the global innovation and technology leader in the dental industry, Sirona has developed a new product generation for the treatment center division. This new product line can be very flexibly configured to suit the needs of various practitioners – dentists should not have to forego outstanding quality, innovative features and modern design depending on how much they can afford to invest in a new center, explained Michael Geil, Vice President Treatment Centers at Sirona and Managing Director of the Bensheim site in Germany. “INTEGO is a future-proof, high-quality German product which satisfies these demands.”

Top quality and flexible configuration options

The new treatment center comes in two versions: INTEGO and INTEGO pro with extended functionality. Each model can be supplied as a hanging hoses model (TS) or with whip arms (CS) in a wide range of shades. Both versions are based on a chair concept which takes the four dimensions of ergonomics into account – intuitive sitting, comfortable positioning, optimum visibility and integrated workflows – and thus ensures that practitioners achieve ideal results. The individual functions, the instruments and all the settings can be simply selected and controlled via intuitive user interfaces. In comparison, INTEGO pro offers enhanced functionality. Some features, e.g., the 4-way foot switch and the automatic disinfection device, are even included in the basic INTEGO pro model. Furthermore, INTEGO pro offers more optional functions: For example, the customer can choose features such as the ApexLocator.

INTEGO is the perfect complement to the product family INTEGO is an ideal addition to Sirona’s treatment center product family and fills the gap between C8+ and SINIUS. With INTEGO TS and CS versions, the dentist element can be positioned above the patient. In contrast, TENEO and SINIUS feature a sliding track which positions the dentist element either automatically or manually. As high-end products, SINIUS and TENEO also offer motorized functions, for example an adjustable headrest, a massage function to ensure patient comfort as well as the option of hand-free operation of the center. As such, Sirona satisfies a wide range of the most diverse requirements made by dentists and patients alike. The treatment centers represent high-quality and proven solutions at an attractive price. As with all other Sirona centers, the INTEGO is also produced in Bensheim, Germany, where it is put through its paces. The long-lasting design, use of high-quality, robust materials, product quality “made in Germany” and a focus on ergonomic operating procedures and patient comfort make this a treatment center which is not only future-proof, but also facilitates the everyday working lives of dentists and assistants. INTEGO is available now from dental dealers. More detailed information on the functions and specifications of this treatment center can be found at the official Sirona company website. The price of the INTEGO will vary between 15,000 and 25,000 Euro, depending on individual configuration.

“I am honored to be a part of such a fine group of clinicians! This looks like a fabulous event!” - Dr. Todd Ehrlich, USA

you are going to be fascinated how easy this camera really is. Dr. Todd Ehrlich, DDS

The new treatment center is a big hit and a real eye-opener for attendees. Dr. Todd Ehrlich, DDS, assistant professor at the Indiana University School of Dentistry, was one of the many attendees who appreciated the new treatment center. “It’s incredible how easy and fast new users learn to operate the new camera CEREC Omnicam. Come learn and engage in this one day lecture/hands-on and discover in how you can integrate CEREC Omnicam to your practice.” - Dr. Vasquez, Dr. Vasquez develops his passion for CAD-CAM dentistry leading him to be trainer for Patterson Dental and Sirona Dental Latin America. He has lectured nationally and internationally for Sirona Dental Systems on CEREC.

“Digital advancements in dentistry are growing at a break-neck speed” - Todd Ehrlich, DDS

Dental Photography Part II: Protocol for shade taking and communication with the lab

By Dr. Eduardo Mahn, DDS, DMD, PhD
Universidad de los Andes
Clínica CEPD Santiago, Chile

Part I of this article discussed the basic equipment that is necessary for digital photography. In addition, a few examples of pictures taken that were better than others for the same situation were also shown. In Part II, a protocol for taking digital photographs will be presented which has been of great help to the author, specifically in achieving the natural shade and value. It is based on standardized pictures that should be taken in order to show certain individual characteristics of the patient to be treated and standardized comparisons of the shade tabs and the natural tooth structures in order to give the technician more information than the usual A2 or A1 written on a piece of paper.

Introduction - Shade-taking

The evolution in digital photography and the possibility of taking pictures and evaluating them immediately as well as almost instantaneously access of the information by someone located off-site in the same city or even another country, we have a great resource available that can help us achieve the right shade of our indirect restorations. Standardized high quality photographs are also an advantage when the shade is taken for a direct restoration - for example a direct veneer or a class IV.

In this case a picture can really help the clinician identify the opalescent areas and the halo effect of the adjacent tooth, before re-doing the restoration (Figure 1).

Dental shade taking at the dental lab or in the dental practice can be frustrating as most dentists do not really know how to use the shade guide when they finish their undergraduate studies. In particular, if work has to be redone, because the technician does not know what was done incorrectly wrong or how to obtain the right shade. Dental shade guides are used by dentists, dental assistants and dental laboratory technicians to communicate proper tooth color, translucency, and brightness. However, many variations come into play no matter what system you decide to use. Before even starting to think about shade taking, you need to answer an extremely simple and obvious question: are you using exactly the same shade system as the lab? There are many shade taking systems available, with variations in the shades between different manufacturers, even though the concept may be the same. They are also manufactured from different materials with different optical properties. For example, some labs are familiar with the Chromacity system, most of the dentists with the A-D shade guide, while the younger generation of dentists learned with the 5M shade guide. (Figure 2)

The role of a shade guide is to help standardize the perception and so facilitate the communication in order to match the shade of the natural teeth with the required restoration.

Shade guides are not a perfect representation of what is actually seen but are close enough to identify a range of tooth colors. Eyes are still the best tool for identifying and communicating the correct artificial shade. Tooth color can be referred to as being an A1 to A2, or between a B2 and B3 when describing the respective tooth closest to the one being restored. It is always best to get the patient to the dental lab and have a custom shade taken, if possible, particularly for the more difficult cases. However, in most of the cases this is not possible, due to unwillingness on the part of the patient to spend time going to the lab, or the location of the lab not being in close proximity.

The use of shade guides should be used in conjunction with digital photography. If no direct light is projected to the mouth and the shade tabs, the main light source will be the flash of the camera, which has always the same temperature (between 5500° and 6000° K) and can be used by the dentist in the clinic and the technician in the lab. When pictures are taken under different light conditions, the variations between the same shades can be considerable. (Figures 3 - 5) A good photo for both the dentist and the lab technician can be obtained so that they are both looking at the same tooth color under the same conditions. When the technician compares the color of the restoration with the shade guide, he can take a picture that will create an image to be used as a comparison under the same light conditions as the natural teeth in the image sent by the technician. (Figure 6)

Due to the flash of the camera, the technician can then determine the restorations look similar to the original shade tab sent by the clinician. (Figure 6, Venereys by CDT Juergen Seger, Liechtenstein)

Tooth Color Basics

Color has two basic characteristics: Hue and Chroma. Natural tooth color also displays these same characteristics. Hue can be defined as the actual color such, as yellow or gray. Chroma is the intensity of that color and is sometimes called saturation. Hue and Chroma are typically represented by a shade guide in terms of which color comes closest to the actual tooth being measured. For example, shade guides will have a range of A1 to A4 or B1 to B4, plus C and D shades. (Figure 17) Value is the brightness of a tooth. It is therefore given a separate classification than color when communicating shade. Teeth also exhibit opalescence and can be measured by how much light can pass through different sections of a tooth. Shade taking problems arise because most natural teeth are not an exact match to a shade guide, nor do shade guides adequately express tooth translucency and value. In many cases, when it is decided that a tooth has a certain shade, the Hue and the Chroma are communicated to the lab, but never the value and this is where the problems arise. Very few crowns are accepted if the value is incorrect, while moderate inaccuracies in chroma and hue may go unnoticed. For this reason the shade taking protocol needs to be based on information being communicated to the lab in the most accurate way possible. Therefore the shade is taken conventionally or a picture is taken for the same purpose, several factors need to be controlled:

1. If patient is wearing bright colored clothing, drape him or her with a neutral colored cover.
2. Have patient remove lipstick and other make-up, as well as eyewear.
3. Teeth must have been cleaned.
4. The shade taking should be done at the beginning of the appointment, so that teeth are moist (the patient must lick their teeth constantly to keep them moist) and your eyes fresh.
5. The operator light should be turned off or pointed in another direction. It must not focus on

Figure 1: This picture will help the clinician to understand the challenge of reproducing the opalescent areas and the halo effect at the incisal third.

Figure 2: Example of different shade guides showing the same shade. The differences are obvious.

Figures 3 - 5: Different appearance of the shade tabs under different light conditions.

Figure 6: The technician should always check the final appearance of the restorations with the use of the natural die material shade guide in order to come to the optimum result.

Figure 7 and 8: Mayor differences in the appearance of the same veneers teeth 11 and 21, due to the use or lack of lipstick. (Thanks for the pictures to CDT Juergen Seger, Liechtenstein)

Tooth Color Basics

Color has two basic characteristics: Hue and Chroma. Natural tooth color also displays these same characteristics. Hue can be defined as the actual color such as yellow or gray. Chroma is the intensity of that color and is sometimes called saturation. Hue and Chroma are typically represented by a shade guide in terms of which color comes closest to the actual tooth being measured. For example, shade guides will have a range of A1 to A4 or B1 to B4, plus C and D shades. (Figure 17) Value is the brightness of a tooth. It is therefore given a separate classification than color when communicating shade. Teeth also exhibit opalescence and can be measured by how much light can pass through different sections of a tooth. Shade taking problems arise because most natural teeth are not an exact match to a shade guide, nor do shade guides adequately express tooth translucency and value. In many cases, when it is decided that a tooth has a certain shade, the Hue and the Chroma are communicated to the lab, but never the value and this is where the problems arise. Very few crowns are accepted if the value is incorrect, while moderate inaccuracies in chroma and hue may go unnoticed. For this reason the shade taking protocol needs to be based on information being communicated to the lab in the most accurate way possible. Therefore the shade is taken conventionally or a picture is taken for the same purpose, several factors need to be controlled:

1. If patient is wearing bright colored clothing, drape him or her with a neutral colored cover.
2. Have patient remove lipstick and other make-up, as well as eyewear.
3. Teeth must have been cleaned.
4. The shade taking should be done at the beginning of the appointment, so that teeth are moist (the patient must lick their teeth constantly to keep them moist) and your eyes fresh.
5. The operator light should be turned off or pointed in another direction. It must not focus on

Figure 11 and 12: Close-up pictures with different shade tabs.

Figure 9 and 10: Overview pictures with different shade tabs.
Once the patient is ready, place the shade tabs in front of the anterior teeth, before starting the treatment itself. The same applies for pictures with lips. It is important to repeat the same protocol intrawisely, as well as extrawisely, because of the large influence of the reds in shade taking. (Figures 7-8) In addition to the points presented before, the following should be considered initially when photographs are taken: (Figures 9-15)

1. Avoid the large reflection areas of the metal parts of the shade guide as they reduce the detail of the pictures
2. Take pictures using two different shade tabs
3. The surface of the shade tab must be at exactly the same level of the buccal surface of the teeth, as even minor discrepancies can make a tooth look darker or brighter due to the power of the flash
4. The incisal edge of the tabs should be at roughly 3mm distance from the natural teeth, or as close as possible, without touching each other.
5. Take pictures with and without contrasters. This is especially relevant in young teeth with opaque areas and clear halo effects.
6. In cases where an all-ceramic restoration is planned, the shade of the stump should also be given to the lab, using a special shade guide, such as the natural die material shade of the IPS e.max system (Ivoclar Vivadent, Liechtenstein). 7. Consider taking some pictures in black and white. A black and white photograph will help show the value of the shade tab in relation to the patient's tooth. (Figure 14)

Clinical case
A 27-year-old female patient came to our office unsatisfied with the appearance of her 2 anterior pfm crowns (Figure 15). The value of both crowns clearly did not match the other teeth and her smile line unfortunately also showed the discolored cervical part of tooth 11 (Figure 16).

An overview picture of the stump shade was taken with a reference (Figure 17a). This reference should ideally be the natural die material A-D shade guide (Figure 17d). Both shade guides, the natural die material guide and the A-D shade guide have some similarities, for example, as a rule of thumb an ND2 looks quite similar to an A2 (Figure 17b). Obviously, the natural die material shade guide has shades that are dark, since its purpose is to correlate to artificially discolored stump and not to recreate natural shades as the A-D shade guide (Figures 17c and 17d). Internal bleaching of the stump was then performed with 55% hydrogen peroxide (Figure 18) in 2 sessions of 20 minutes each. Figure 19 shows the final result after the composite build-up with Excite DSC, and Multilayer Flow (Ivoclar Vivadent, Liechtenstein). An impression was taken and sent to the lab, the cast was scanned and an IPS e.max CAD LT block was milled (Figure 20). The final shade guide, such as the natural die material shade guide of the IPS e.max system (Ivoclar Vivadent, Liechtenstein). 7. Consider taking some pictures in black and white. A black and white photograph will help show the value of the shade tab in relation to the patient's tooth. (Figure 14)

mCME SELF INSTRUCTION PROGRAM
CAPP together with Dental Tribune provides the opportunity with its mCME-Self Instruction Program a quick and simple way to meet your continuing education needs. mCME SELF INSTRUCTION PROGRAM allows you the flexibility to work at your own pace through the material from any location at any time. The content is international, drawn from the upper echelon of dental medicine, but also presents a regional outlook in terms of perspective and subject matter.

Membership:
Yearly/membership subscription for mCME: 600 AED
One Time article newspaper subscription: 200 AED per issue. After the payment, you will receive your membership number and Allowance to start the program.

Completion of mCME
• mCME participants are required to read the continuing medical education (CME) articles published in each issue.
• Each article offers 2 CME credits and are followed by a quiz.
• Quizzes are available online on the mCME website.
• Each quiz has a minimum passing score of 80% must be achieved in order to claim credit.
• No more than two answered questions can be submitted at the same time.
• Validity of the article – 3 months
• Validity of the subscription - 1 year
• Collection of Credit hours. You will receive the summary report with Certificate, maximum one month after the expiry date of your membership. For single subscription, summary reports will be sent one month after the publication of the article.

The answers and critiques published herein have been checked carefully and represent author’s opinions on the questions concerned.

Articles are available on www.cappmea.com after the publication. For more information please contact events@cappmea.com or +971 4 3636274

The diode laser as an electrosurgery replacement

**By Glenn A. van As, BSc, DMD**

In 2008, Dr. Gordon Christensen wrote an article in **Dental Tribune** comparing the soft tissue cutting abilities of diode lasers to those of electrosurgery (radiosurgery) units. In comparing these two technologies against each other, he found that both diode lasers and the less expensive electrosurgery units have advantages and disadvantages, and he summarized with several key points:

1. Although there was considerable overlap in their uses and both technologies were effective, Christensen found that diode lasers were able to be used around metal (alumina and gold) as well as with dental implants.

2. He stated that lasers did not harm dental hard tissues (bone) or soft tissues (pulp), and that the clinician could use the laser with less anesthesia, and finally he mentioned that lasers were antimicrobial (antibacterial).

3. The acceptance and use of lasers, especially the diode laser, was increasing in dentistry, and that lasers attract patients because of their recognized and accepted role within the field of medicine (LASIK eye surgery).

4. Electrosurgery units were “less expensive than the least expensive diode lasers” and he questioned whether “the advantages of the diode laser were significant enough to compensate for the additional cost.”

5. There are two basic types of electrosurgical units that can be purchased in dentistry:
   - Monopolar, in which a single electrode contacts the tissue, and due to the pain that is produced, anesthesia must be used.
   - Bipolar, in which two electrodes are placed in very close proximity to each other. Bipolar units are more expensive than diode lasers and the electrical current flows from one electrode to the other, thus eliminating the need for a grounding pad. Bipolar units, because of the two wires, create less of a precise cut than the monopolar or diode laser.

Although electrosurgical units are inexpensive, require no safety glasses and can remove large amounts of tissue quickly, diode lasers have become much more common in dental operations in the four years since Christensen’s article was published. The primary reasons for their increased popularity are that diode lasers have a small footprint, are reliable and durable lasers, and are portable. Where a few short years ago, diode lasers could cost in the range of $10,000 to $15,000, they are now cost effective and can be purchased for less than $2,900.

Diode lasers are also useful for both teeth and soft tissues.

**Ability to work around metals introradially**

Diode lasers in the range of 810-1,064 nm are well absorbed in hemoglobin, melanin (pigment) and to some degree water. (Fig. 1). These mid infrared wavelengths in the absorption spectrum offer the dental clinician the ability to ablate soft tissues precisely while controlling hemostasis, providing the clinician with an excellent view of the surgical site with a reduced reliance on sutures. Diode lasers have features that make them attractive as mentioned earlier, but they also have several advantages in function over electrosurgical units (Table 1).

Perhaps the greatest benefit of lasers is that they allow the clinician to work safely around metals. The literature has shown that monopolar electrosurgical units can accidentally create catastrophic results when touching metal introradially. Published reports have shown that contact for very short periods of time with the electrode of a monopolar electrosurgical unit can cause both pulpal and periodontal problems, bone loss, severe intraradial burns, and that within three seconds of exposure to a dental implant electrosurgical unit can cause failure of osseointegration and loss of an implant."1

In clinical practice, with today’s emphasis on the more esoterically pleasing composite resins and newer porcelains, there are still many metallic materials used introradially, including cast partial denture frameworks, gold, amalgam, orthodontic brackets and semi-precious alloys. Diode lasers, unlike their electrosurgical counterparts, show little interaction with metallic objects used introradially. It is important to remember that due to the laser’s ability to reflect off mirrored surfaces and potentially cause eye damage, that all members of the dental team as well as the patient must wear laser safety glasses for eye protection if they are within the nominal ocular hazard zone (NOHZ) during laser operation. This zone is often between 3 and 7 ft, but some diodes can have extended NOHZ ranges of 40 ft.

Orthodontic patients will often exhibit gingival hyperplasia when brackets that can make it difficult to work on them. This overgrowth of tissue can be due to poor oral hygiene, space-closing mechanics, excess cement or a combination of factors. The diode laser can be used for gingivectomy to safely remove and contour the excess tissue and healing can be remarkable in a very short period of time (Figs. 2-4).

**Ability to work around dental implants safely**

Various laser wavelengths that are available today can offer the clinician who needs to expose an implant during second stage surgery an alternative to traditional methodologies. The ability of the diode laser to ablate tissue, at times without the need for local anesthetic, while controlling hemostasis, provides the clinician a great view of the surgical site.

In addition, the diode wavelength, like all laser wavelengths, provides for decontamination of the implant site through its anti-bacterial actions. Hemostasis and even the reabsorption of blood can lead to almost a sterile operative field (98 percent reduction of pathogenic bacteria). Finally, there is a growing body of evidence that suggests that lasers used at lower energy settings can have a bio-stimulatory effect on tissue, which can turn out to be a great benefit in the accelerated debridement and shortened healing times while even improving early osseointegration.2

As an aside, there have been clinicians who routinely use monopolar electrosurgery units to expose implants. It is imperative to realize that although more expensive bipolar (two electrodes) electrosurgery units can be used safely around implants, that the more commonly purchased single electrode (monopolar) units may damage the implant surface and prevent proper osseointegration with resulting implant failure with contact times as short as three seconds.34 Lasers, in contrast, can be used safely with tremendous coagulation and retraction in dent postoperatively for the patient” (Figs. 5, 6).

Many patients are looking for alternatives to local anesthesia, and when the occasion allows for the procedure to be completed without the patient being numb, there is a new crop of patients who have achieved that. Situations such as laser gingival...
The risk of recession and exposure and precisely completed on maxillary anterior teeth can be of the soft-tissue contours in the same day as the preparations are completed (Figs. 17-19).

The diode laser has become a popular technology as an alternative for tissue management compared to the traditional methodology of placing a single or double retraction cord in the sulcus. The diode laser can be used in almost all instances to produce gingival retraction as an alternative to cord with excellent results both in terms of gingival retraction and margin delineation for the laboratories.

Unlike electrosurgical units where recession can be an issue, as can postoperative pain, diode lasers suffer the clinician the ability to precisely remove overhanging, inflamed tissue while creating a gingival trough that is not likely to cause damage to bone, cementum or pulp tissue like electrosurgical units can. In addition, there is research that suggests that the lateral thermal damage done with lasers is significantly lower than that with electrosurgery.21

Vascular lesions caused by lasers or hemangomas can occur on soft tissue areas including the upper and lower lips, nasal mucosa and palate. These lesions can be difficult to treat with traditional methods where significant bleeding in an area occurs. The diode wave lengths are rapidly absorbed by hemoglobin and therefore can be used to coagulate and eradicate these esthetically undesirable purplish lesions often with only topical anesthesia. Literature has shown that the diode laser can be used in almost 100 percent of cases to eliminate these lesions, most often in only a single session lasting only a couple of minutes20-22 (Figs. 20-22).

Anti-bacterial capabilities of lasers

Many articles in the literature have demonstrated the tremen-
dous ability of all lasers with respect to the reduction of bacterial and even fungal infections.23-24 The excellent antibacterial capabilities make lasers effective and desirable in many areas in the oral cavity where the risk of postop-erative infection may be reduced. Electrosurgical units do not typi-
cally possess the same ability to provide bacterial reduction as lasers do. Particular interest is now occurring with the role of lasers in endodontic, periodontic and peri-
implantitis cases where there is need to reduce bacterial loads without such a great reliance on antibiotics.

Although more research is needed on how the bactericidal capabilities of the diode laser might be beneficial in these areas, there is no debate that all lasers can help healing through decreasing the risk of infection through laser light alone (Figs. 25-27). In addition, growing research has demonstrated that the risk of high bacterial loads in peri-
odontal pockets and in particular in certain situations may be reduced by lasers.

This latest research has implications for improving traditional methodologies locally where used, and in helping to reduce the potential greater systemic health risks. The role of lasers continues to be researched today, but present research has shown that diode lasers can be used safely within root canals with minimal fear of developing iat-
rogenic complications when con-
servative settings are used.20-22

Conclusion

The diode laser has become the “surgical hammer” in many dental offices. The advantages of being able to work around metals including dental implants, a reduced need for anesthesia, a reduced risk of recession post-operatively, the ability to reduce bacteria, and to use the diode to photocoagulate vascular lesions has all provided dentists with a new alternative for soft-tissue surgery.

Laser's have two added benefits in that they do not require a pad to be placed under the patient for grounding, and they can be used safely with pacemakers. Diode lasers have found their place in dentistry. Once considered an application looking for a purpose, these small, cost-effective and re-
liable lasers have discovered their niche as the new go to solution for many soft tissue problems in our daily dental practices.

Weightlifter grits his teeth – a case for VITA ENAMIC

By Hermann Loos

Stress and high demands literally make us grit our teeth. On a colleague’s homepage it says on the subject of teeth grinding and bruxism: “We can develop a weightlifter’s strength just by using our teeth”. The masticatory organ is exposed to forces of up to 800 newtons during teeth clenching. The normal pressure of mastication is generally around 20 - 30 newtons. Those affected are often people in certain professions, for example, those who work for long periods of time on the computer, as well as those whose work involves intensive physical exertion, like runners, cyclists, bodybuilders and, as previously mentioned, weightlifters.

During subconscious clenching of the upper and lower teeth, the limit of physiological function is far exceeded. Not only natural tooth substance, however, but also restorative materials reach their limit during mechanical overload. In the clinical case example described here, this led to the fracture of an old all-ceramic crown restoration.

Patient case
The patient was a weightlifter by profession. He sought treatment for a fracture on the vestibular wall of his all-ceramic crown on tooth 25 (Fig. 1). He wanted a new, metal-free restoration. For the sake of time efficiency, treatment was planned with the CEREC chairside system.

The material of choice
A suitable material in this case was the new VITA ENAMIC, whose material composition and mechanical and physical properties offer a combination of ceramic and composite. The hybrid ceramic is a completely new generation of ceramic materials. The unique, dual network structure consists of a dominant ceramic network reinforced by a polymer network. This follows the principle of compound materials, i.e. both networks penetrate each other mutually. Thus immense stability as well as extraordinary elasticity are guaranteed for the first time. In addition to classic, single tooth restorations (inlays, onlays, veneers and crowns), VITA ENAMIC's range of indications includes minimally invasive restorations and restorations exposed to high masticatory forces. VITA ENAMIC is available in the geometry (size) EM-14 (12 x 14 x 18 mm) and in the translucency levels HT (High Translucency) and T (Translucent) and in five VITA SYSTEM 3D-MASTER shades 0M1, 1M1, 1M2, 2M2 and 3M2. VITA ENAMIC can be processed with Sirona’s CEREC or inLab MC XL systems, software version 4.0 or higher.

The treatment procedure
After removing the fractured crown, further preparation suitable for ceramic was carried out on tooth 25 (Fig. 2). The digital impression (Fig. 3) was performed using the CEREC 4C acquisition unit and the Bluecam. The CEREC 3D-software's automatic biogenetic tooth modelling function was used for designing the crown restoration (Fig. 4). Occlusion registration was performed. The opposing jaw was not scanned. The biogenetic reconstruction of the occlusal surfaces is based on a mathematical procedure that allows the automatic reconstruction of the patient’s individual tooth morphology based on the morphology of the patient’s re-

* In addition to a high degree of elasticity, this innovative hybrid ceramic guarantees particularly high strength after adhesive bonding.

VITA ENAMIC® redefines load capacity.*
The first hybrid ceramic with dual network structure for unsurpassed absorption of masticatory forces

VITA ENAMIC sets new standards for resistance by combining strength and elasticity and providing unsurpassed absorption of masticatory forces. VITA ENAMIC ensures utmost dependability and efficient processing for dental practices and laboratories. And patients feel that VITA ENAMIC restorations are identical to natural teeth. VITA ENAMIC is particularly suited for crown restorations in the posterior area and minimally invasive restorations. More information at www.vita-enamic.com

maining natural dentition. We obtained very good results using the 3D-software to adjust the occlusion of posterior crowns with the aid of the centric bite registration function and the automatic adaptation of the crowns’ occlusion with the antagonists. When required, manual corrections can be made by the user at any time. Figures 5a and 5b show the crown in the milling preview after completion of the design. According to the results obtained in situ (shade of prepared tooth 4L2,5 / tooth shade 3M2), a block in the shade 3M2 was chosen for the manufacture of the crown. The VITA ENAMIC Polishing Set clinical and the VITA ENAMIC STAINS KIT are available for reworking chairside manufactured VITA ENAMIC restorations. The polishing set includes a total of eight polishers for the handpiece, four for prepolishing and four for high-glaze polishing. A staining set is also available. Beside six stains, this also includes VITA ENAMIC Glaze for sealing the surface. The stains and the glaze are light-curing and very easy to process. The definitive intraoral cementation of the marginally accurate crown (Figs. 6 and 7) was performed with Multilink Automix (Ivoclar Vivadent), since VITA ENAMIC has a high loading capacity after adhesive bonding with the residual natural dentition. Material benefits Experience shows that the new VITA ENAMIC blocks can be milled very quickly from the digital design. This ensures milling results with high precision, edge

C
leanic® prophy paste by Kerr has a creamy and smooth consistency. It also has a pleasant fresh taste that is not too strong and is well accepted by the patient. This creaminess and the clever use of binding agents have made the paste easy to use. Available in a tube, used with both cups and brushes, the paste stays more compact on the tooth surface, thereby avoiding the unpleasant sensation caused by coarse particles left in the patient’s mouth.

Within a few seconds after application (during the cleaning cycle), Cleanic® paste removes extrinsic discoloration caused by chlorhexidine or stains caused by cigarette smoke. (If either of these are present in a patient at a recall of 6 months, the application should be repeated). About 8 seconds after application, the paste automatically starts its polishing action thanks to Perlite technology making the tooth appear smooth and shiny.

After our usual professional oral hygiene procedures (debridement, scaling and root-planing), Cleanic® paste, compared with others on the market, seems to be less apparent in the gingival sulcus.

Pro-BrushTM new generation brushes are very suitable for patients with dental overcrowding or malpositioned teeth. Plastic replaces the traditional metal part and allows the brush to rotate more efficiently. This helps to prevent damage to adjacent teeth.

Pro-Cup® cups have been designed and developed to avoid pastes being splattered as with traditional cups. cleanic® prophy paste by Kerr has a creamy and smooth consistency. Pulp protection in today clinical practice: what about the role of materials?

By Dimitrios Tziadas, DDS, PhD

Vital Pulp Protection and Therapy (VPPT) is the treatment of choice to protect the pulp tissue in a healthy and functional state, whenever the development of the tooth has been compromised by caries, trauma or restorative procedures. Pulp vitality, odontoblast layer, is not essential for mature tooth survival. Mature permanent teeth with a vital pulp can survive for a long time after a successful endodontic treatment. However, the maintenance of pulp vitality in both mature and developing teeth provides benefits, n immature permanent teeth the vital pulp can act as a barrier to the bacterial infection process, allowing for continuation of root development and strengthening of the roots. In the context of mature teeth with living pulp the capacity of the dentin-pulp complex of mature permanent teeth to repair dentin defects and to retain the damaged complex as a functional entity, allows for vital pulp therapy for the long-term survival of dental pulp tissues. A network of inflammatory reactions of pulpal cells, microcirculation and nerves, directly affect the outcome of the fundamental defensive mechanisms in the dental pulp. Whenever the basic structure of pulp periphery is affected due to exogenous stimuli, it is well recognized that the damaged dentin-pulp complex requires protection from thermal conduction, chemical injury from the overlying restorative materials and further bacterial invasion from den dentinal caries or oral bacterial leakage. It must be clarified here that protection from thermal conduction depends mainly on the conductivity of the main restoration and is beyond the scope of the present article. In order to assess the therapeutic validity of the currently available endodontic materials in vital pulp protection, the biology of dentin-pulp complex is briefly reviewed.

Biology of dentin-pulp complex

The pulp and the dentin have been widely considered as a complex, highly mineralized tissues, forming an embryological and functional entity. The dentin-pulp complex is a critical clinical concern as in primary, important are issues related to different pathophysiology and healing potential of the dentin-pulp complex, as in primary, immature and mature permanent teeth.

- Dental treatment of primary teeth must satisfy different goals than treatment for mature permanent teeth, due to the limited life span of primary teeth and their possible relationship to the permanent tooth successor. The anatomical structure, pathophysiology, and diagnosis of endodontic diseases are different between primary and permanent teeth. However, recent advances in primary tooth biology demonstrated that primary teeth have also a potential for wound healing and tertiary dentin formation. In light of these observations, VPPT in primary dentition has been already re-evaluated and similar techniques as in permanent teeth are widely used (American Academy of Pediatric Dentistry, 2006).
- Similarly, dental treatment

The reader of the present article is encouraged to study a number of excellent papers reviewing experimental and clinical observations as well as the level of evidence in relative clinical research, which have been presented in the symposium held on 2007 in Chicago, Illinois, on "Emerging science in pulp therapy: new insights into dilemmas and controversies" jointly sponsored by American Association of Endodontists and American Academy of Pediatric Dentistry (see Pulp Symposium, Journal of Endodontics, July 2008, Volume 34, Number 7S). It has been well recognized that the following critical factors are playing a role. a. Treatment indications as has been well demonstrated the VPPT is indicated for teeth with healthy pulp or reversible pulps. More particularly, pulp protection, where a material is placed on the pulp surface of a dentinal cavity to act as a barrier between the permanent restoration and the sound, dentinal base of the cavity, is indicated for: a. Carious or non-carious tooth cavities with remaining dentin thickness less than 1 mm, no history of lingering or spontaneous pain, negative percussion and palpation tests and positive pulp vitality test, and ii. Young permanent teeth after luxation trauma and crown fracture exposing the inner third of the dentin, regardless of the presence of clinical symptoms. Indirect pulp capping is a technique in symptom-free teeth with deep carious lesion where a thin zone of carious dentin is removed to avoid pulpal exposure. The ultimate goal of this technique is to complete caries removal just before the pulp exposure, where the potential most important requirement for wound healing and tertiary dentin formation. In light of these observations, VPPT in primary dentition has been already re-evaluated and similar techniques as in permanent teeth are widely used (American Academy of Pediatric Dentistry, 2006).
The operative trauma has been also implicated with pulpal injury and subsequent pulp healing. Frictional heat due to uncontrollable mechanical cavity preparation, over-drying of the exposed dentin, direct damage to odontoblastic processes in deep cavities, and the chemical treatment of the dentinal surface due to acid-etching, may be associated with transient pulp damage and/or increased dentinal sensitivity, which can delay pulp healing, while also development irreversible pulpitis cannot be excluded.

The role of materials - In general similar materials are widely used in today clinical practice for both sites, pulp protection in deep sound dentin cavities, and in active carious dentin lesions, despite the facts that the objectives of the two techniques are clearly different. For many years the hard setting zinc oxide-eugenol cements have been used under amalgam restorations, and the hydroxide-containing cements have been considered as materials of choice for pulp protection in deep dentin cavities, especially in cases of indirect pulp treatment, e.g., of glass ionomer cements, as well as resin-modified glass ionomers have been evaluated during the last two decades, while direct application of adhesive materials in the base of the cavities has also been proposed. Recently calcium silicate-based materials, acting as dentin replacement materials, are under preclinical and clinical evaluation.

Four criteria seem to be concerned to the characterization of an effective pulpal protective material (see table): Physical properties Adherence to dentin, resistance to dissolution, setting time, flow, and dimensional stability represent the most important physical properties of an ideal pulpal protective material. The physical limitations of Ca(OH)2-based materials, such as the non-adherence to dentin, dissolution in tissue fluids and degradation upon tooth flexure ranked them in the last position of the materials for using in pulp protection. Lack of any adherence to dentin has also been found for the zinc oxide-eugenol based materials. On the opposite excellent physical and mechanical properties have been reported for the resinous materials. Glass ionomers present several important properties, such as an elasticity similar to dentin, and bonding to dentin and enamel. However glass ionomers are not resistant to water and have a slow setting rate. Improved physical properties have been obtained with the resin modified glass ionomers. Newly released calcium silicate-based dentin substitutes have also showed interesting physico-chemical properties. Antibacterial activity It is widely accepted that the ability of the pulp protective material to reduce bacterial leakage and to prevent post-operative growth of leaking bacteria and their invasion into dentinal tubules is the most critical requirement to avoid deleterious pulp inflammation and necrosis (Bergholtz 2005, Smith, 2002, Tri- atlas 2010). Furthermore several micro-organisms could be isolated from deep carious lesions and hence, the use of a material with antimicrobial activity under real conditions has been highly recommended. Since bacteria can differentially affect the ability of odontoblasts to re-pair the dentine barrier function, and to confirm these issues.

Biocompatibility Absence of cytotoxic effects and biocompatibility of the restorative materials are reasonably of critical importance to reduce the possibility of pulp tissue irritation or degeneration. Various cell culture systems, implantology testing models in animals or usage tests in animal or human teeth have been repeatedly evaluated the biocompatibility of materials used as pulp protective bases. Calcium hydroxide-based materials have been much studied and represent the gold standard in the research of dental material biocompatibility. Conventional glass ionomers are highly biocompatible materials, while the resin modified glass ionomers, the resin composites and the adhesive systems have been shown to be considerably more cytotoxic, due to the release of non-polymerized monomers (BISGMA, UDMA, TEGDMA, HEMA). These monomers can cause directly pulp inflammation in toxic concentrations, or dramatic reduction of the defensive ability of the pulp in sub-toxic concentrations. However histological studies in deep cavities of human teeth are expected to confirm these issues.

Bioresorbability It is associated with the capability of material to stimulate re-formation of dentin permeability (barrier function). Systematic investigations on the ability of the use pulp protective materials, including the gold standard group of calcium hydroxide-based materials, to mediate inflammation in the underlying pulp and to the role of capping material in reduction of bacterial growth is important. Histological investigations have demonstrated prevention for bacterial growth in almost 100% of the restorations with glass ionomer-based materials, in caries free teeth of young adults for post-operative period up to one year. In a few recent studies the MTX and hydroxyapatite-based materials showed significantly better antibacterial activity than Ca(OH)2.
Editorial report on the Dental Hygiene Day at the 9th CAD/CAM & Digital Dentistry International Conference
09-10 May 2014 Dubai

By Victoria Wilson, Dental Hygiene Therapist, UK

Dubai, UAE: A truly remarkable day for Hygienists in the MENA, over 100 Hygiene delegates attended the first Dental Hygiene Day on Saturday May 10th, 2014 which was a continuation of the 9th CAD/CAM & Digital Dentistry Intl Conference, May 09-10, 2014 at the Jumeirah Beach Hotel, Dubai, UAE. Hygienists practicing in the UAE and from other countries in the MENA attended the first of its kind in the Middle East.

The timetable included a variety of relevant topics tailored specifically to the Hygiene profession.

The exceptional speakers made it worthwhile for any hygienist to attend.

Prof. Crawford Bain delivered an interesting informative lecture on the maintenance of the dental implant patients, an extremely relevant topic for all Hygienist in light of the growing number of implants being placed and the crucial role of the Hygienist in the necessary maintenance.

Dr. Matthieu Gabriele gave a lecture on Oral Hygiene protocols and complications with various fields of dental treatment, a must know-how for every Hygienist.

Dr. Rasha Ahmed presented the important topic on dentine hypersensitivity management. Hygienists face patients common complaints of hypersensitivity on a daily basis, and the well presented topic by Dr. Rasha was much appreciated by the audience.

Victoria Wilson’s Lecture, the Editor of Hygiene Tribune, focused on communication within Dentistry, a topic essential for the delivery of oral health education and achieving long term compliance and maintenance of oral health.

The afternoon consisted of a hands on course on periodontal instrumentation, with the renowned Prof. Mary Rose Pinelli Boglione from Italy and the International Federation of Dental Hygienists IFDH. Due to the popularity and demand the course was extended to 2 days. We were honored to have such an expert in the profession join us on a revision of the essential skills of scaling and instrumentation. Hygienists are trained extensively on scaling and instrumentation in their education, however it is easy to fall into bad habits. This was an invaluable refresher course for Hygienists and we hope that Mary will join us in the future for more courses. Dr. Rasha Ahmed also delivered a very informative hands on continuing course in the afternoon on the practical application of the management of dentine hypersensitivity.

In the 7 years I have been living and working in the UAE I have never known for there to be such an extensive program for the profession on one day and for so many Hygienists to be in one room at one time.

The year 2014 is an exceptionally exciting time for the profession of Dental Hygiene in the MENA. Four months ago the Dental Tribune Middle East opened the Dental Hygiene Tribune section dedicated entirely to the Dental Hygiene profession. More and more dental and medical professionals are requesting to have a Hygienist on board. Following on from the Dental Hygiene Day we look forward to more Hygienists days by CAD/CAM with more hands on courses, and lectures tailored to the needs of hygienists professionals.

What we all have to keep in our minds is that a healthy periodontium is the backbone to all good restorative dentistry and medical treatment – not in the whole process an essential part in over all health and wellbeing.
Reveal your patients’ most healthy, radiant smile with Philips Zoom WhiteSpeed

New Philips Zoom WhiteSpeed Light-Activated Whitening System.
A better experience for your patients and your practice.

Philips Zoom In-Office Whitening kit makes treatments easier
Packed in procedural order, you get everything you need for each treatment, including Philips Zoom at-home whitening gel for follow up and maintenance complete in a single package. The Philips Zoom Kit also includes simplified visual instructions.

Unique products for your sensitive patients
Each treatment comes with a Patient Post Care and Maintenance kit that includes the Relief ACP Oral Care Gel. This unique formula combines potassium nitrate for sensitivity relief along with Amorphous Calcium Phosphate (ACP) that helps create healthier smiles through advanced enamel protection. To ensure a more comfortable experience all around, instruct patients to use it for 10-30 minutes after treatment.

New Philips Zoom WhiteSpeed Whitening LED Accelerator
The advanced Philips blue LED technology provides approximately 50,000 hours of use—reducing operating costs, downtime and is 40% more energy efficient. The light also emits 100% greater light intensity* with no compromise to safety. Redesigned to be easier to position and more ergonomic, your patients and your treatment will be better than ever.

New support for your practice
Philips Zoom is funding a worldwide public relations campaign to drive patients to dental professionals, and new programs to help you quickly and easily integrate Zoom into your practice.

“At this new light the patient’s sensitivity is minimal, making the procedure much more pleasurable.”
– Juban Dental Care - Baton Rouge, LA

Reveal your patients’ most healthy, radiant smile with Philips Zoom WhiteSpeed

Give your patients the immediate white smile they want and the healthy white teeth they need, with the new Philips Zoom WhiteSpeed. The number one patient-requested professional teeth whitening brand* is clinically proven to deliver superior whitening results in just one office visit. WhiteSpeed is shown to whiten teeth up to 8 shades in 45 minutes; that’s 40% better than a comparable non-light activated system.†

The new Whitening LED Accelerator’s variable intensity settings allow you to customize the output to ensure each patient receives a more comfortable treatment. 91% of patients experienced little to no sensitivity with Zoom WhiteSpeed.‡

Now better than ever — Philips Zoom WhiteSpeed.

Philips introduces its best brush yet, Sonicare DiamondClean, helping users achieve brushing brilliance every time

By Philips

Dubai, UAE - Philips is proud to present the new Sonicare DiamondClean - a brush that cleans your teeth to its most sophisticated level and which delivers Sonicare's best clean yet removing up to 100% more plaque in hard to reach places than a manual toothbrush.

Sonicare DiamondClean harnesses Philips Sonicare's patented sonic technology to produce a powerful dynamic cleaning action for a difference that users can see and feel. It is gentler on teeth and gums than a manual toothbrush, helping to keep teeth stronger and healthier for longer. Philips Sonicare gently whips toothpaste into an oxygen-rich foamy liquid and directs it between and behind teeth and along the gumline - a new Sonicare feature to display in the most fashionable way.

Sonicare DiamondClean is clinically proven to remove up to 100% of plaque from hard to reach places and to improve gum health in just 2 weeks. It is also clinically proven to whiten teeth in 1 week; and its gentle technology actually helps protect against gum irritation and recession to help reduce sensitivity. Now is the perfect time to give your teeth the celebrity treatment and switch to Sonicare to really experience the difference.

The brush is able to deliver a unique whole mouth clean feeling thanks to its five brush modes that allow you to tailor your brushing according to your needs as well as your dental professional's advice. The brush modes range from:

- Clean - the standard mode for a whole mouth clean
- White - removes surface stains to whiten teeth
- Polish - brightens and polishes teeth to bring out their natural brilliance
- Gum Care - gently stimulates and massages gums
- Sensitive - an extra-gentle mode for sensitive teeth

Highly charged

DiamondClean's chrome base also features a unique charging technology to charge the toothbrush as it rests in the glass - making it stylish enough to display in the most fashion-forward bathroom.

Not only is Sonicare DiamondClean Philips' most advanced brush yet, it's also our most easy to use and stylish. DiamondClean's power handle has a ceramic finish and a chrome accent ring highlights the elegant neck of the brush. The technology in the handle is hidden so that the sleek matte white finish of the brush is uncluttered by electronic visual displays. Only when the on button is pressed are the brushing displays illuminated to reveal the array of options. These are then simply selected by scrolling down using a one button action.

When traveling or on the go, Sonicare DiamondClean is designed for convenience with users being able to keep their brush fully charged using a revolutionary USB travel case that can be plugged into almost any lap top computer and saves the hassle of having to pack plugs and adaptors. But only the most intrepid travellers need worry about this advanced feature as Sonicare DiamondClean holds an impressive three weeks charge.

Brilliant cut

Sonicare DiamondClean brush heads also sport a new diamond-cut tuft formation to provide you with an even more efficient brushing experience. The uniquely designed diamond bristle heads have 44% more bristles than Philips Sonicare's standard sized ProResults brush heads, providing you with both superior plaque removal and whiter teeth. The heads come in two sizes - Standard and Compact - for focused cleaning in areas of special need, for orthodontic patients and those with smaller mouths.

How much do you care for your hands?

By Beverley Watson RDH, Kings College, London

London, UK: It is understood that out of many professions, Dental Hygienists are in the high risk category of suffering from Repetitive Strain Injury RSI or Carpal Tunnel Syndrome CTS. This article aims to evaluate ways to reduce this risk.

Two widely used brands of Hand instruments are to be evaluated as a comparison, LM DuraGradeMax and American Eagle XP Technology.

Method: Online research publications.

Conclusion: After reviewing the information from both LM and American Eagle instruments, it was found that some parts of the LM information in Figure 5 was not able to clearly state what it was trying to prove. Yet with electron microscopy photographs and the Rockwell hardness test proves the hardness of the cutting edges of American Eagle instruments.

Objectives: To determine the best ways a Dental Hygienist can avoid RSI or CTS through-out their career. This will include exercises' and what to be aware of when choosing ergonomic hand instruments for hand scaling, such as the comparisons LM DuraGrade- Max and American Eagle XP Technology. The criteria will be judged on the handles light weight quality, the best grip and the need for sharpening.

XP Technology American Eagle

- Specially filtered titanium nitride/stainless steel alloy not a coating but infused.
- Rockwell hardness test most steel instruments 58-60, XP 89, Diamond 100
- Strokes 1500 XP = 1,500 other

DuraGradeMax LM steel

- Hardened steel alloy by thermo-mechanical heat treatment, controlled gas atmosphere and cryogenic processing.

Figure 7 shows its durability out lasts any other instrument including XP Technology.

Figure 1. The repeated activity can compress the median Nerve travelling through the Carpal Tunnel.

Figure 2. Examples of stretching exercises to perform between patients.

Figure 3. Examples of treatment options for RSI or CTS when the strain has become chronic, and simple exercises are inefficient.

FROM THIS

movement and overdue?

This clearly describes a Dental Hygienists average working day, the repetition of the same movements. RSI can affect different parts of the body the neck, shoulder, elbow, wrists and hands. For the purpose of this article the focus will be on the wrist and hands.

Four common causes of RSI:

1. Repetitive activities
2. Doing a high-intensity activity for a long time without rest

5. Poor posture or activities that require work in an awkward position
4. Holding the instrument USS or hand scalers with the wrist is bent. It is best to keep the wrist in line with the arm not at an angle compressing the median nerve (Figure 1).

Signs and symptoms can vary but the most common are pain, aching or tenderness, stiffness, throbbing, tingling or numbness, weakness and cramp.
Help your patients eat, speak and smile with confidence with the Corega® denture care regime.

Dentures contain surface pores in which microorganisms can colonise.¹

Corega® cleanser is proven to penetrate the biofilm* and kill microorganisms within hard-to-reach surface pores.²

SEM images of denture surface.

*In vitro single species biofilm after 5 minutes soak

Date of preparation: June 2014.

For full information about the product, please refer to the product pack.
For reporting any Adverse Event/Side Effect related to GSK product please contact us on contactus-me@gsk.com.
In ‘bleeding on probing’ trials over 4 weeks, parodontax® demonstrated significant effects in reducing bleeding gums by 22% (p<0.01)

Bleeding on probing increased after 4 weeks of brushing with the fluoride control toothpaste

Adapted from Saxer et al 1994. All interdental spaces from 6+ to +6 were tested at baseline and 4 weeks for bleeding on probing on the right side (buccal) and left side (lingual). Findings were recorded as 0=no bleeding; 1=slight/isolated bleeding; 2=marked bleeding. Mean scores were determined. N=22.

Baseline values [Mean SD]: Control (fluoride-containing toothpaste) group 24.75 (6.34); parodontax® group 25.40 (6.80). After 4 weeks: Control (fluoride-containing toothpaste) group 26.00 (9.14); parodontax® group 19.80 (7.38). *parodontax® vs control p<0.05.

Helps stop bleeding gums
Prevention: Take regular hand breaks to stretch and exercises the muscles, tendons and ligaments. See Figure 2 for some possible exercises.

Breaks don’t only include time away from scaling, but also time away from the computer and writing notes. Typing can also compress the nerves in the Carpal Tunnel.

Treatment: If it is not possible to take long term time out from the activity causing the repetitive strain on the small muscle groups, then it is necessary to take regular short breaks and stretch (Figure 2, 5).

A hand splint, the hand is held in a relaxed position to take pressure of the Median nerve running through the Carpal Tunnel and as a final resort surgery.

A brief history of Hygiene

The earliest recorded text asso-
ciated with dental hygiene dated 5000 BCE where tooth picks were used in Mesopotamia (ear-
ly Iraq) according to the M den-
stury Time line of Dental Hy-
giene, but it was not until 1915 in USA, Connecticut that Alfred C. Fones trained 97 Dental Hy-
gienists and the Dental Act set regulations stating their duties. Then in UK 1945 saw the 1st Dental Hygienists trained in the Women’s Auxiliary Army WAAF. Instruments: The 1st Dental hand instruments were very thin and heavy with smooth metal handles requiring a very tight grip. Later a cross hatch was scored into the metal han-
dles for easier grip but were still very thin, wider lighter steel gripped handles were intro-
duced and in the last 10 years a wider ergonomic soft silicone rubber was used around a metal inner part then came into production, a very light completely resin handle with a grip for less wear on the muscles and tendons.

Ultra Sonic Scalers have dra-
matically improved the Dental Hygienists ability to remove hard deposits from the tooth surface by either working in a Magnetoconductive or Piezoelectric capacity. This reduces the need for excessive forces applied by the hand over an ex-
tended period of time increasing the risk of strain and inflamma-
tion of the wrist muscles and tendons resulting in RSI or CTS (Figure 4).

Sharpening: Numerous articles state the different methods of sharpening instruments. Arkansas stone different shapes round, flat, long, short, Differ-
ent sizes, angles, grades course, medium, fine.

• Machines: The Hu-Friedy in-
strument sharpener, the LM Rondo- plus electrical disc sharpener

The Neivert Whittler to name a few.

The consistency of the preci-
sion of angulation is unpredicta-
ble and operator error possible. It is possible to affect the cutting edge, causing more strain on the fingers hand and wrist. It is human nature to not sharpen immediately when required. Figure 5 shows the different types of next generation hard-
ened steel.

Results: LM handles present to be ergonomically superior with a wider silicone grip to help keep the Carpal Tunnel open, howev-
er they do still contain an inner part of steel. This runs the entire length of the handle increasing the overall weight compared to the completely resin handle of the American Eagle.

The XP Technology instru-
ments requires no sharpening at all, and will allow more repet-
tive strokes with minimal pres-
sure on the tendons and wrist. The LM DuraGradeMax state a hardened steel alloy more dura-
tly than the XP Technology. It is advised to send the instruments back to the LM company for fac-
tory sharpening, requiring dou-
ble the amount of instruments in order to continue a full working schedule, resulting in LM being less cost effective. Once the XP technology tips becomes dulled it is feasible to use their Quick tip to replace the tip at less cost than the full instrument.

The statistics in Figure 7 do not clearly state how the results were determined for LM instru-
ments, it is not clear what number of times 5, 7, 5 and 5 represent, minutes, hours, Days, Strokes? It is possible however to see in the photographic evidence 15000 strokes to 1,500 from American Eagle instruments.

Regarding the hardness of the Steel alloy of the LM instru-
ments there is no evidence to support this but the American Eagle XP instruments have the Rockwell hardness test to prove their claim.

Conclusion: In conclusion the Ultra Sonic Sealer should be used as much as possible to avoid excessive strain on the transverse carpal ligament and median nerve. It is clear that some calculus deposits remain interdentally after Ultra Sonic Scaler alone. Ultra Sonic Scal-
ing alone is not sufficient and hand instrumentation is neces-
ary in conjunction with Ultra Sonic Scaling.

The correct choice of hand in-
strument is essential for a Den-
tal hygienist to help avoid RSI. It seems the American Eagle lightweight resin handle with the XP Technology blade will be of most benefit long term. Due to its superior strokes carried out 15000 to 1,500 before starting to dull.

For this reason it seems the American Eagle XP technology would be in the instrument of choice compared to the LM DuraGradeMax. The American Eagle XP will ensure less pres-
sure is exerted on the median nerve, the transverse ligaments and the carpal tendons reducing the risk of RSI or CTS.

KaVo CAD/CAM workflow with the new products ARCTICA AutoScan, KaVo multiCAD Virtual Articulator and VITA ENAMIC

By KaVo

With the production of two monolithic posterior crowns, the KaVo CAD/CAM application technology demonstrates a practical case in which the new CAD/CAM products ARCTICA AutoScan, KaVo multiCAD Virtual Articulator and VITA ENAMIC for ARCTICA play a major role.

Described below are the following individual steps, which consist of:
1. Order preparation
2. Scanning
3. CAD construction
4. Preparation for manufacture
5. Manufacturing
6. Completion

Order preparation: 50 seconds

First, the practitioner, the patient and the respective technician are defined in the order entry form. The second step consists of the definition of the indication including all parameters. In the present case, this concerns the creation of two full crowns to be made of Vita ENAMIC Regio 46 and 47. The parameters for the respective practitioner can be referenced in the KaVo multiCAD software. This function guarantees consistent quality regardless of the originator of the order (Figure 1, 2).

Scanning: 180 seconds

This case is scanned with the new fully-automatic ARCTICA AutoScan. The scan process is very simple as the software guides the user step by step through the scan process. The individual scans are performed completely automatically. First, the upper jaw is scanned, followed by the lower jaw. If necessary, single stumps may then be scanned separately. This is followed by a vestibular scan allowing the correct positioning of the jaws by the software (Figure 3).

The next step consists of matching the individual jaw scans and the vestibular scan by marking three identical points on the respective jaw and vestibular scan. Afterwards, the software calculates the exact position of the upper and lower jaw scans (Figure 4, 5, 6).

Construction of the restoration in the KaVo multiCAD software: 180 seconds

In the KaVo multiCAD software, the contact relief of the corresponding jaw is displayed in the scan software. For analytical purposes, it may be displayed in color. The respective color and intensity indicate the distance to the antagonist.

Afterwards, the articulator KaVo PROTAR evo 5B is inserted into the articulator by means of a facebow. The respective patient-specific settings of the physical PROTAR articulator such as, for example, the condyle track inclination and the Bennett angle, are entered into an entry mask. The correct positioning of the models in the virtual articulator (KaVo PROTAR 5B) is done automatically. Based on the scan of the articulated models in the ARCTICA AutoScan and the positioning of the models by the KaVo Splitcast system, the correct positioning is automatically transferred to the CAD software. This positioning also applies to models that were inserted into the articulator by means of a facebow.

After the adjustment of the patient-specific parameters, the motion tracks are simulated and any interferences are corrected by the software (Figure 7, 8, 9).

The illustration shows a laterotrusion to the left (Figure 10).

In the subsequent construction process, the movements of the jaws may be visualized at any time (Figure 11).

The manufacture of the two VITA ENAMIC crowns on 46 and 47 is performed quickly and easily by means of library teeth that are automatically positioned onto the preparations and may be loaded into the situation via a simple mouse click. Furthermore, the library teeth may subsequently be matched to the individual occlusal relief of the chewing surface. The user is able to adjust the suggestions of the software via a wizard (step-by-step assistant) at any time during the construction process. Various tools
Giomers are a remarkable class of bioesthetic restorative materials that exhibit the aesthetics, strength and durability of nano-hybrid resin composites, further enhanced with the benefit of fluoride and anti-plaque effect pertaining to S-PRG fillers.

These unique fillers are manufactured through Shofu’s patented PRG filler technology that imparts Beautifil II, Beautifil Flow, Beautifil Injectable and FL-Bond II with protective fluoride benefits and greater tissue tolerance.
Now is the time to consider investing in your own CBCT System

By Ernesto Jaconelli

This Century has seen the introduction of 3D imaging as a readily available dental diagnostic tool. This trend has been inspired by the development of both Cone Beam Computed Technology (CBCT) and PC storage capability making 3D imaging more convenient, easier to use, and affordable.

To be able to view the area of interest in all three dimensions significantly improves the accuracy of diagnosis and this in turn makes for faster better patient treatment. Each year new systems are becoming available such as the new CS 8100 3D System form Carestream Dental. These new systems are now significantly smaller, more versatile and user friendly than their predecessors. The CS 8100 3D has a “resting” width of 35cm (110cm when in use) and weighs only 92kg so will fit easily into most compact dental clinics.

A very important feature of all modern CBCT systems is that they provide the Dentist with a choice of volumes that will be right for the area of interest. These volumes are known as the Field of View (FOV). The CS 8100 3D for example gives choices from taking a 2D Panoramic to capturing a selection of 3D FOVs of 4 x 4 / 5 x 5 / 8 x 8 and 8 x 9 mm. As with all x-rays it is essential to minimise the dose to the patient - the larger the FOV the more dose to the patient. Each area of dental surgery will require a different FOV depending on the treatment being considered so it is essential to have a choice of FOVs to select from.

For a single implant a FOV of 5 x 5 mm will be sufficient and the dose to the patient in this case will be similar to that from a 2D panoramic scan. However for the preparation of multiple implants or surgical guides then a single arch FOV of 8 x 8 / 8 x 9mm FOV would be selected. Dentists who specialising in Implants were the first to fully appreciate the benefits of 3D imaging such that it is now unusual to find one who does not have their own CBCT system.

For Endodontists, the key diagnostic tool is always their surgical loupes. But they are also adopting 3D image to reveal more clearly any additional canals that are present and possibly missed from a 2D image as well as their exact position and apical areas. A sectorial FOV of 5 x 5 mm will provide a very high definition image for an Endodontist to be able to examine the area in precise detail.

Until now Orthodontists have mainly been satisfied with a 2D panoramic view. However having a CBCT system that switches easily from a 2D panoramic to 3D image allows the Orthodontist to select a 3D view when required. Retention and angulation for example are more precisely diagnosed from an 8 x 8 / 8 x 9 mm FOV.

3D imaging will soon be the norm for dental diagnostics requiring all dentists to be familiar with the technology and capable of analysing 3D images. There has never been a more appropriate time to consider having your own CBCT System. Manufacturers are supplying more in depth training such as at the Carestream Dental Training Centre at Ajman University of Science and Technology, and now that CBCT systems are available from 40,000€, a return on the investment can be achieved within two years.

Having the choice of either a 2D panoramic or a range of 3D FOV’s is ideal

The CS 8100 compact size will fit into most Dental Clinics

Simple, planned aesthetic orthodontics for the General Practitioner

By Dr. Tif Qureshi

Dr. Tif Qureshi shows how digital technology has moved progressive smile design on and the enormous benefits this will bring to both the patient and consent. Digital Smile Design is making a come back in a very smart and intelligent form through the use of live video, cameras, and keynote presentations.

I commend the users of this technique as it is clearly a far better form of smile design planning than just using plain static before and after pictures with someone else’s smile stitched into place.

However in cases where there are alignment issues, I would still argue that any patient who does not at least go down the pathway of alignment and bleaching, cannot really see their teeth change in a dynamic wax. I have found that patients’ feelings about their smiles change once they think they want one thing but after they see their smile change a little they start to appreciate it in a different way. How can someone really be consented unless they are given the opportunity to bleach their teeth, perhaps with slight alignment and bonding.

This case is the perfect example and will show how progressive smile design also using digital technology can produce beautiful predictable results that often require far less invasive treatment.

We use digital technology in a different way of course and this is all to do with planning and consent. Previously with Inman Aligners, we had to use hot wax models. These are effectively fairly crude stone models which take a cut and once repositioned in wax the aligner is then built on that model. As soon as the aligner is fitted into an uncorrected mouth the forces are there to push the teeth to the final position. The real downside of it all the wax creates quite large inaccuracies. Also it is very difficult to see how much adjustments have been made to the teeth to get them to fit within the curve. This is even more so of a problem for flared teeth which have been out of the arch for many more years. These teeth tend to be highly triangular and often need more targeted adjustment to get them to fit within the arch form. You can visualize the wits of these teeth, it is almost impossible to accurately know how much production is required to each.

Of course with digital 3-D printing this has all changed. The difference if you like is night and day. We can also use print-and-project forms in a different way. How can someone really be consented unless they are given the opportunity to bleach their teeth, perhaps with slight alignment and bonding.

Of course with digital 3-D printing this has all changed. The difference if you like is night and day. We can also use print-and-project forms. This has all changed. The difference if you like is night and day. We can also use print-and-project forms.
tooth shaping with PPR (predictive proximal reduction). This made it far easier for him to understand the processes required to create the space. Finally he could also see the differential wear in his tooth outline that would be evident after alignment. He clearly understood that edge bonding and tooth contouring might be required after alignment and bleaching were complete. That is assuming he did not want to continue with porcelain veneers.

It was noted that the patient had reviewed and understood the 3-D model and what it was proposing. The Inman Aligner was then built and fitted.

Treatment
Inter-proximal and Predictive proximal reduction were carried out in a progressive and measured manner over 5 visits. This was done to ensure good anatomy and to reduce the risk of gingivitis, over stripping and poor contacts. With Inman Aligner treatment stripping is never carried out in one go.

Composite anchors were also placed in a timed and sequenced manner to ensure the forces could be directed at the right time. This allows for rapidly increased treatment times.

After only nine weeks the patient's anterior teeth had nearly aligned. Bleaching trays impressions were taken at this stage. Super sealed trays are used to bond the wire in place. The patient bleaches 35 to 45 minutes a day while the aligner is out of the mouth. After a week the patient returned his teeth had improved in alignment already but with the improvement in color as well made him view his teeth in a different way.

At this point he decided not to have porcelain veneers and instead to ask for composite bonding and buildings. He had seen examples of this already. We used some mockup flammable material to show the patient what was possible and he was thrilled with the results. So an appointment was booked for 2 weeks to have this done.

Composite bonding was carried out on the 7, 9 and 10. A composite veneer was placed on the 11. All these were carried out with only roughening and no prep or bevel. Venus Diamond composite from Heraeus Kulzer was used. I find that the Opaque dentine, it means a long bevel is not required to block out the join. Enamel shade can then be placed thicker towards the incisal edge. A wire retainer was fitted and the guidance adjusted to ensure there were still balanced excursive contacts on the left side so the load was not focused on the deciduous tooth.

Roughening, total etch Opti-bond solo and Venas flow were used to bond the wire in place. A clear essix retainer was also given to the patient to wear at night initially then to use occasionally and to have as a back up if the wire de-bonded.

Discussion
At this point he decided not to have porcelain veneers and instead to ask for composite bonding and buildings. He had seen examples of this already. We used some mockup flammable material to show the patient what was possible and he was thrilled with the results. So an appointment was booked for 2 weeks to have this done.

Composite bonding was carried out on the 7, 9 and 10. A composite veneer was placed on the 11. All these were carried out with only roughening and no prep or bevel. Venus Diamond composite from Heraeus Kulzer was used. I find that the Opaque dentine, it means a long bevel is not required to block out the join. Enamel shade can then be placed thicker towards the incisal edge. A wire retainer was fitted and the guidance adjusted to ensure there were still balanced excursive contacts on the left side so the load was not focused on the deciduous tooth.

Roughening, total etch Opti-bond solo and Venas flow were used to bond the wire in place. A clear essix retainer was also given to the patient to wear at night initially then to use occasionally and to have as a back up if the wire de-bonded.

On viewing the sequenced shots it is clear to see the changes. The patient was delighted that he had emerged from the treatment with his own teeth looking more attractive than having ceramic porcelain veneers. As good as ceramic restorations are, they will always require further treatment/maintenance and replacement. On a 22 year old if alignment, bleaching and bonding can satisfy the patient that it has to be better than placing ceramic veneers. The problem with digital smile design is that the patient is not really given the opportunity to see the teeth change slowly and in situ.

It is fine if whitening, bonding and alignment are part of those protocols but arguably patients should not be shown images of multiple veneers until they can visualize their own teeth looking better. You can see how very subtle changes can dramatically improve the appearance. Even though the colour is not truly homogenous and the teeth have a mottled appearance the most important thing here is that the patient was completely delighted with the treatment.

Ultimately a patient being happy with their own smile has to far outweigh the parameters that are set up traditional smile design.

Final images at the 6 month review are also shown.
interferences remaining after the construction will be displayed by the software and automatically removed in consideration of both static as well as dynamic factors (by means of the virtual KaVo PROTAR Evo 5B) including the previously identified motion tracks. This allows for a drastic reduction or even the complete omission of subsequent follow-up work in the mouth of the patient for the practitioner. Not only does this facilitate time and cost savings, the danger of chipping may be reduced as well (Figure 12, 15).

The following colour illustration shows the occlusal pattern after dynamic adjustment (Figure 14).

In the image, one can clearly recognize the deviations (color markings) between the static and dynamic structure and the adjustment of interferences in the chewing relief.

The dynamic adjustment may be displayed over the static one as wire netting. Any interferences to be expected are clearly recognizable (Figure 15).

After the dynamic adjustment, the finalized VITA ENAMIC crowns may be displayed in the KaVo multiCAD module TruSmile in a photo-realistic manner (Figure 16, 17).

Preparation for manufacture in the KaVo CSS: 60 seconds

The next steps for the completion of the dentures are performed in the KaVo CSS software, which is a job, material, tool and machinery management software by KaVo. First, the manufacturing method is defined. This means that the user has the opportunity to send the produced,
open STL data of the restoration to his ARCTICA engine, his Everest engine or to other KaVo milling partners via the free KaVo Everest portal. The work to be manufactured and the predefined material to be used may be reviewed in a 3D view. If necessary, additional modifications such as, for example, a change of the material may be made.

After the selection of the KaVo ARCTICA engine as the production machine and a VITA ENAMIC for KaVo ARCTICA block, which was previously booked into the KaVo CSS via RFID technology, the nesting, i.e. the positioning of the restoration in the virtual material block, may be performed (Figure 18).

Now, the blanks are inserted in the block bracket of the ARCTICA engine and affixed with a torque wrench with a defined tightening torque (Figure 19, 20, 21).

Afterwards, the tool stack with the tools required for the Vita ENAMIC - in this case, 4 different grinding tools with diameters between 0.6 – 3.6 mm - is inserted. These tools were also previ ously booked in the KaVo CSS software via RFID chip and assigned to the glass ceramic tool stack. The advantage is that the tool service times are precisely logged and that the ARCTICA engine uses a traffic light pattern (green, yellow, red) to show the user when a tool should be exchanged. This also helps to minimize application errors.

In case of an automatic tool change in the KaVo ARCTICA engine, the tools are once again inspected with a laser for breakage or faulty positioning once they have been removed from the stack.

The processing is started at the touch of a button on the touch-screen of the ARCTICA engine or, alternatively, directly at the PC (Figure 22).

Completion of the VITA ENAMIC crowns: 180 seconds each

After the successful production of the two restorations on the KaVo ARCTICA engine, the VITA ENAMIC crowns may be separated from the material block. The ARCTICA engine may be connected to a KaVo lab handpiece (ERGOgrip and POWERgrip) and used to further process the works. Prior to the start of the grinding procedure, there is also an opportunity to reduce the diameter of the connectors to a minimum at the end of the production process, so that the time expended for the separation of the restoration becomes negligible.

After the grinding procedure, the VITA ENAMIC crowns are polished in a time-saving manner with the tools from the VITA ENAMIC polishing set. An additional subsequent individualization of the work is possible with the colours of the VITA ENAMIC stains kits. In this case, an additional individualization was omitted upon the request of the patient (Figure 23, 24, 25).

Thanks to the use of the virtual articulator during the construction in the KaVo multiCAD software and the precise 5-axis technology of the ARCTICA engine, the work could be inserted directly into the mouth of the patient and corrections of the occlusal relief could be waived. As can be seen, precisely integrated process chains pay off.
stimulate directly tertiary dentin formation and to intratubular mineralization, are entirely lacking from the literature. A few recent investigations at the preclinical level have shown that application of newly commercialized calcium-silicate based materials in deep dentinal cavities resulted in rapid stimulation of the bioanalytic activity of odontoblasts and dramatic reduction of dentin permeability. Again, all these data have to be confirmed clinically.

In conclusion, despite the fact that numerous scientific articles studied experimentally or clinically the pulp protective materials in experimental or clinical investigations (Björndal et al. 2010) and a number of critical and systematic reviews discussed their results, it must be emphasized that they have not been evaluated for the complete range of their effect. Given that application of a calcium hydroxide-based material in combination with a glass ionomer seems to be the best choice according to the guidelines of American Academy of Pediatric Dentistry and the preclinical research delivered by the American Association of Endodontists, further randomized multi-centered controlled clinical research is needed to assess firstly the overall role of capping material in the VPPT, and then the ability of today used and/or newly developed materials to provide long-term pulp protection.

describes using of Smile Design inside CEREC software and soft-ware DSD Connect by Dr. Josef Kunkela. Dr. Kunkela is an innovative Czech dentist with extensive experience in prosthodontics, restorative dentistry, preventive care and dental marketing. He currently pre-sents his research in Czech Repub-lic, USA, Germany, France, Ireland, Malta, Poland, Hungary and Slovakia. He also organizes practical courses in prosthodon-tics and CAD/CAM dentistry in the Czech Republic. His studies are published in the dentistry journals Quintessence, Inter-national CAD/CAM Magazine, Dental Tribune and DentalCare Magazine.

Five table clinics will operate from 11th to 13th September in groups. Outstanding CEREC trainers will run a premiere ex-tensive training for future and advanced CEREC users. Par-ticipants will have the opportu-nity to interact immediately and ask their personal questions of interest. The practical demonstra-tions will, at the same time, provide inspiration and other means of trouble shooting.

Dr. Todd Ekrich, USA - Sum-mer of CEREC “If you are a current CEREC user wanting to hone your skills, or someone curious about the technology, this narrative in-struction will guide you for the best outcome.”

Dr. Daniel Vasquez, USA - Ex-plore CEREC Omnicon “It’s incredible how easy and fast new user learn to operate the new Camera CEREC Omnicon. Come learn and engage in this One day lecture/hands-on and discover in how you can inte-grate CEREC Omnicon to your practice.”

CEREC InLab Basic & Advanced Training is featuring Dental Technicians, Mr. M. Al-Zu’bi, Canada Mohammad Al-ZaBi-RDT, owner of Optimus Den-tal Lab Inc.; a Crown & Bridge lab which focuses on Digital Dentistry and CAD/CAM Tech-nology. How the InLab system works for non users. Digital work flown in Dental Laboratory-ries. Material used with the sys-tem. Utilizing the system to the fullest potential! Mohammad is a Sinora Beta Tester, Sinora international speaker/trainer, CEREC & InLab basic/advanced Trainer, Founder of the InLab Study Group. He has been a den-tal technician for 18 years work-ing in most lab departments.

CEREC inlay is one of the most common indications for patient restoration – be it on a vital or root-canal treated teeth. The sheer quantity and frequency of these procedures may result in a large number of errors unless one is intimately familiar with all the strengths and weaknesses of the used work-protocol and applied materials. Dr Josef Kun-
